

Taco Store Application

Capstone 2

Version 7.1 Y

Setup

Capstone Setup

For this capstone you should have a public GitHub repo. Make sure that the capstone repo has a meaningful name, like `taco-licious` (do not just give it a generic name like `capstone-2`)

Create the project repo in the `C:/pluralsight/capstones` folder.

Create a GitHub project board to manage your work. Use the project requirements to create user stories on your board so that you can manage your time throughout the project.

Be sure to read all project requirements before beginning to code.

Capstone Description

This project is the point of sales application for TACO-licious, a custom taco shop. Currently at TACO-licious our customers can fully customize their taco orders. Until recently we have been managing all orders in person and are currently taking all orders on paper. But our business is growing, and we need a way to automate the order process (and eventually even make it available online).

This application should take full advantage of Object Oriented Analysis and Design. In other words, you should make use of OOP concepts throughout this process.

Create classes and interfaces as necessary to build this solution. As you begin this project you should start by creating a class diagram of the classes, interfaces that you will need. This will be your starting point, and it may change as your application progresses throughout the week. You should keep your diagram current. You should also save the diagram to your repository.

HINT: Use the requirements below to look for nouns and verbs to help you create your class diagram.

Application Requirements

The taco/burrito is the core of our business. Customers can order tacos in 3 sizes (Single Taco, 3-Taco Plate, Burrito). When they order, they choose the type of tortilla that they would like (corn, flour, hard shell, or bowl). The customer can then choose their toppings. Toppings are categorized as regular and premium. Proteins and cheeses are premium toppings, but most other toppings are considered regular.

Customers can request for extra toppings, but premium toppings come at an additional cost. Each taco/burrito can be covered in salsa and queso.

A customer can place an order with 0 or more tacos on the order. If a customer places an order with 0 tacos, they must purchase chips & salsa or a drink.

When a customer places the order, they should be prompted to customize each taco one at a time.

A customer should also be able to add drinks and chips & salsa to their order.

When they have completed their order, the application should display the order details, including the list of tacos that were ordered with all the toppings so that the customer can verify that the order is correct. The screen should also display the total cost of the order.

When the customer completes the order, the order details should be saved to a receipts folder. Each order should have its own receipt file, and it should be named by the date and time that the order was placed

(yyyyMMdd-hhmmss.txt - i.e. 20230329-121523.txt)

Taco Prices	Single	3-Taco	Burrito
Shell - corn - flour - hard shell - bowl	3.50	9.00	8.50
Toppings	Single	3-Taco	Burrito
Meats - carne asada - al pastor - carnitas - pollo - chorizo - pescado	1.00	2.00	3.00
Extra Meat	.50	1.00	1.50
Cheese - Queso Fresco - Oaxaca - Cotija - Cheddar	.75	1.50	2.25
Extra Cheese	.30	.60	.90
Regular Toppings - lettuce - cilantro - onions - tomatoes - jalapeños - radishes - pico de - guacamole - corn	Included	Included	included
Sauces - salsa verde - salsa roja - chipotle - habanero - mild - extra hot	Included	Included	Included

Sides - lime wedges - crema	Included	Included	Included
Other Products	Small	Medium	Large
Drinks	2.00	2.50	3.00
Chips & Salsa	1.50		

Your application must include several screens with the listed features in order to be considered complete:

- **Home Screen**
 - The home screen should give the user the following options. The application should continue to run until the user chooses to exit.
 - **1) New Order**
 - **0) Exit** - exit the application
- **Order Screen** - All entries should show the newest entries first
 - **1) Add Taco**
 - **2) Add Drink**
 - **3) Add Chips & Salsa**
 - **4) Checkout**
 - **0) Cancel Order** - delete the order and go back to the home page
- **Add Taco** - the add taco screen will walk the user through several options to create the taco
 - **Select your shell:**
 - **Taco size:**
 - **Toppings:** - the user should be able to add extras of each topping
 - **Meat:**
 - **Cheese:**
 - **Other toppings:**
 - **Select sauces:**
 - **Would you like the taco/burrito covered in salsa and queso?**
- **Add Drink** - select drink size and flavor
- **Add Chips & Salsa** - select salsa type
- **Checkout** - display the order details and the price
 - **Confirm** - create the receipt file and go back to the home screen
 - **Cancel** - delete order and go back to the home screen

(Optional Bonus) Challenge Yourself

If you have time and want to challenge yourself, consider the following:

Create several Signature Tacos that are a template for what the customer can order. The customer could then customize the existing toppings to either remove or add more toppings to the taco.

HINT: Signature Tacos could be managed by creating custom classes that inherit from the Taco class.

Signature Tacos might include:

- **Street Tacos**
 - 3-Taco
 - Corn Tortillas
 - Carne Asada
 - Onions
 - Cilantro
 - Salsa Verde
 - Lime Wedges
- **Super Burrito**
 - Burrito
 - Flour Tortilla
 - Carnitas
 - Cheddar
 - Pico de Gallo
 - Lettuce
 - Tomatoes
 - Covered

Other General Project Requirements

Your project must also meet the following requirements:

Repository

- Your code must be in a public GitHub repository
- You must use Git branches appropriately
- The repository must contain an appropriate Git commit history
 - **Minimally**, you should have a commit for each meaningful piece of work completed
- It must contain an informative README file that:
 - Describes your project
- Include exports or screenshots of your diagrams

Class Demonstrations

Each student will be given 10 minutes to demonstrate their project to the class on "project demonstration day". During this time, you will:

- Present your application - run through the different screens and scenarios
- Describe / show one interesting piece of code that you wrote
- Answer questions from the audience if time permits
